

# weedingtech & Foamstream

## Leading the way on moss and algae control

### The world's leading herbicide-free option for eradicating moss and algae

Moss and algae present an ongoing challenge for local authorities, utilities companies and contractors to control. On top of this, it can be costly to deal with and treatment can be fraught with environmental and safety concerns. As the world's leading herbicide-free weed control company, Weedingtech and its award-winning product Foamstream, presents an opportunity for organisations to remove moss and algae quickly and effectively, reducing costs and improving health and safety.

### Effectiveness

When it comes to tackling moss and algae, Weedingtech's MW-Series and innovative Foamstream product is **the most effective solution on the market** – even when compared to herbicide alternatives. Foamstream can be used on moss and algae in **any season, no matter the weather**, completely eradicating the plant with just **one treatment per year**.

### How it works: instant kill, long-lasting results

Unlike most weeds, the roots in moss sit on the surface of the plant. This means that when Foamstream is added directly to the plant, its combination of hot water and foam instantly coats and attacks the roots, killing the moss and stopping it from returning for **at least 12 months**.

## Here's how Foamstream works:

- Heat is applied to the moss in the form of 99.7% hot water and 0.3% foam
- The foam acts as a blanket, keeping the heat on the moss long enough to kill it
- A wetting agent in the foam speeds up the transfer of heat into the moss roots
- The moss dies within minutes

## Health & safety: above and beyond

The use of Foamstream on moss and algae in public spaces also improves health & safety. It does this in two ways:

**1 Slip reduction:** Foamstream can be used across all hard and soft surfaces, including playgrounds, sports surfaces and large industrial areas. After just one treatment, Foamstream ensures that moss and algae in all treated areas are removed, reducing slip and trip hazards for the public and employees

**2 Herbicide-free:** Foamstream is 100% herbicide-free and therefore eliminates any concern over the use of increasingly-controversial herbicides such as glyphosate

### The proof

Our clients throughout Europe have unequivocally and enthusiastically reported extremely high levels of success when using Foamstream on moss and algae.

The American War Cemetery in Cambridge reported strong results after just one application of Foamstream:

Tackling moss on cobbled walkways

6 hours after treatment

Significant success has also been reported by Rainfords Contracting Services while treating moss beside the Manchester Ship Canal as part of a £90m initiative to restore the area. Again, with just one pass moss and algae were eradicated with the company remarking on its 'brilliant' performance:

Health, safety and environmental solutions company Cowens Ltd agrees that Foamstream is the best solution for tackling moss and algae in a quick, effective and safe way:

*"Foamstream is an excellent innovation and a good step forward for the contracting industry. It kills moss brilliantly and is therefore an effective, environmentally-friendly alternative to chemical herbicides. What is more, it is perfectly safe to use in public places, even areas near water where particular care is needed."*

Richard Rainford,  
Rainfords Contracting Services

*"I am concerned to ask my employees to use glyphosate so the non-toxic solution Weedingtech offers is ideal. The moss and weeds are killed effectively and results are evident immediately. We did not have to fence off the areas being treated and no special training was needed for the operator."*

Jonathan Coulthard, Managing Director,  
Cowens Ltd.

## Trial it!
